

TECHNICAL DATA SHEET

REMOTE CALL BELL UNIT

PRODUCT DETAILS

The Remote Call Bell Unit is an extension of a Standard Call Bell Unit (previous page) that is situated at the shaft gate. The unit allows for activation from a position outside of the station area that is behind a traditional shift control gate.

Operation: The unit transmits the following signals:

Accident to person = 10 Rings, followed by the station (level) ID and repeated.

Accident to shaft = a long ring, followed by the station (level) ID and repeated.

A LED light indicates which unit was activated and must be reset at that particular level.

The Remote Call Bell Unit will only operate if the main Call Bell is equipped for remote facility
